Michael Neumann

Senior Research Scientist at **Modality.AI**

Dear Michael and Modality.AI Team,

Thank you again for the insightful conversation at **IMS**. As agreed, I am attaching my application documents. I am very interested in an internship at your company, starting as early as **June 15, 2026**.

My thesis focuses on detecting **Alzheimer's** disease from spontaneous speech, with a strong emphasis on generalizability and interpretability. I work in **Python** on both baseline and transformer-based models to classify transcripts, extract linguistic features, and analyze model behavior. To ensure transparency, I apply **SHAP** and **Integrated Gradients**, and I conduct systematic error analyses to uncover biases across age, gender, and cognitive score bands. This combination of hands-on modeling, explainability, and rigorous evaluation is the approach I hope to continue and expand at **Modality.AI**.

My long-term goal is to continue and extend my contribution to accessible, clinically grounded tools for early disease detection. Your integration of **NLP**, **acoustic modeling**, and **vision for neurological assessment** aligns strongly with my research interests and career aspirations.

Language has always been central to my academic path, from linguistics and international relations to understanding accents, discourse analysis, and neurodiversity. This foundation naturally led me to automated, machine-driven analysis of human expression.

My leadership skills were tested and strengthened during my time in the EU policy environment, where I organized several hackathons on sustainable and WHO-related topics and coordinated interdisciplinary teams.

I look forward to hearing from you and would be happy to answer any questions in an interview or demonstrate my technical skills in a coding session.

Best regards,

Gloria Galasso
